sdcSpatial: Privacy protected maps

sdcSpatial: Privacy protected maps

Goal:

Create maps, and ensure that no details are revealed on individuals.

sdcSpatial: Privacy protected maps

`sdcSpatial` has methods for:

- Creating a raster map: `sdc_raster` for pop density, value density and mean density, using the excellent `raster` package by Hijmans (2019).
- Which locations are sensitive: `plot_sensitive`, `is_sensitive`
- Adjust raster map to protect data: `protect_smooth`, `protect_quadtree`
- Remove sensitive locations.

Who am I?

- Statistical consultant, Data Scientist @cbs.nl / Statistics NL
- Expertise:
  - **R programming**
  - Data Cleaning with R
  - **Data visualization**
  - Complex networks analysis
  - @edwindjonge / https://github.com/edwindj

What is SN / CBS?

Statistics Netherlands is producer of all main official statistics in the Netherlands:

- Stats on Demographics, economy (GDP), education, environment, agriculture, Finance etc.
- Part of the European Statistical System, ESS.

Motivation for `sdcSpatial`

- ESS has European Code of Statistical Practice (predates GDPR, European law on Data Protection): no individual information on persons and enterprises may be revealed.

Sdc in `sdcSpatial`?

SDC = “Statistical Disclosure Control”

Collection of statistical methods to:

- Check if density map is safe to be published
- Protect data by slightly altering (aggregated) data
  - adding noise
  - shifting mass
- Most SDC methods operate on records.
- **`sdcSpatial` works upon location data.**

Lets create a raster map with `sdc_raster`

```r
library(sdcSpatial)
unemployed <- sdc_raster( dwellings[c("x", "y")]
                        , dwellings$unemployed
                        , r = 500
                        , min_count = 10 # min support
                        )
print(unemployed)
```

```
## logical sdc_raster object:
##    resolution: 500 500 ,  max_risk: 0.95 , min_count: 1
##    mean sensitivity score [0,1]:  0.4249471
```

What is the sensitivity?

Binary score (`logical`) per raster cell indicating if it's unsafe to publish.

Calculated:

a) Per location (x_i, y_i) (raster cell)

b) Using risk function `disclosure_risk` $r(x, y) \in [0, 1]$. How

Type of raster density maps:

Density can be area-based:

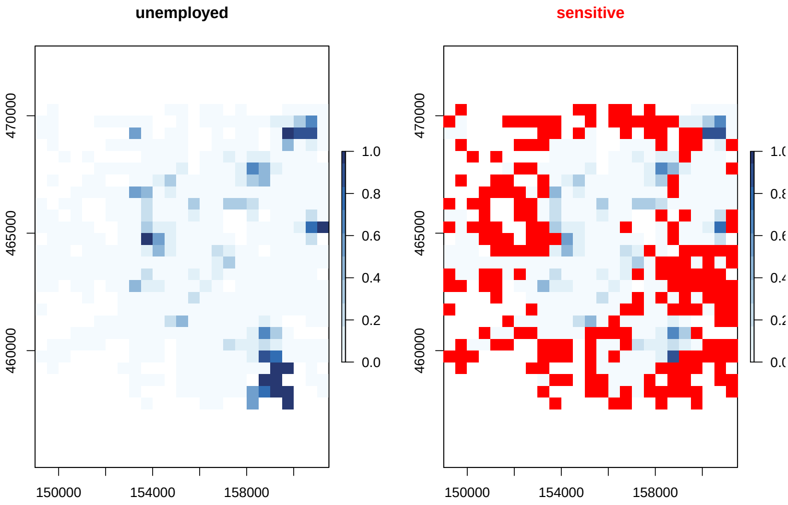
- number of people per square (`unemployed$value$count`): population density
- (total) value per square (`unemployed$value$sum`): number of unemployed per square.

Or density can population based: - Mean value per square (`unemployed$value$mean`): probability of being unemployed per square.

All types can be valid, but note that (total) value per square strongly interacts with population density. (see https://xkcd.com/1138)

So let's plot!

```
plot(unemployed)
```



how to improve?

Options:

a) Use a coarser raster: `sdc_raster`.

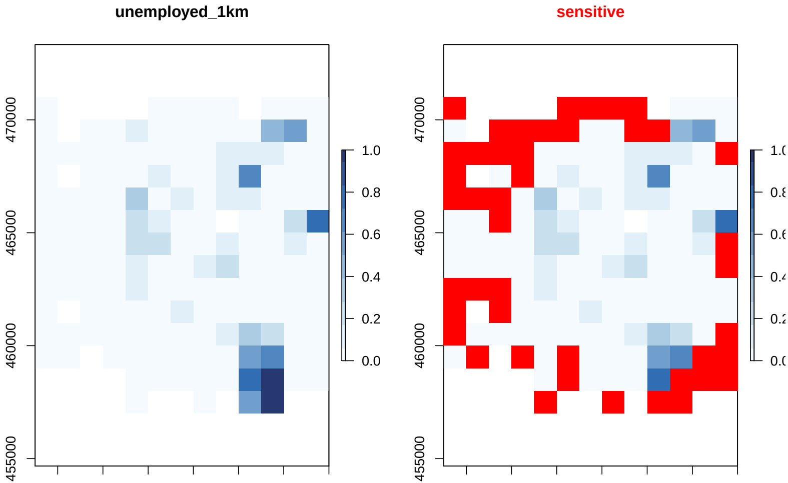
b) Spatial smoothing: `protect_smooth` method by Wolf and Jonge (2018), Jonge and Wolf (2016).

c) Quadtree aggregation: `protect_quadtree` method by Suñé et al. (2017).

d) Removing sensitive locations: `remove_sensitive`.

Option: coarsening

```r
unemployed_1km <- sdc_raster(dwellings[c("x", "y")], dwelli
plot(unemployed_1km)
```



Option: Coarsening

Pros

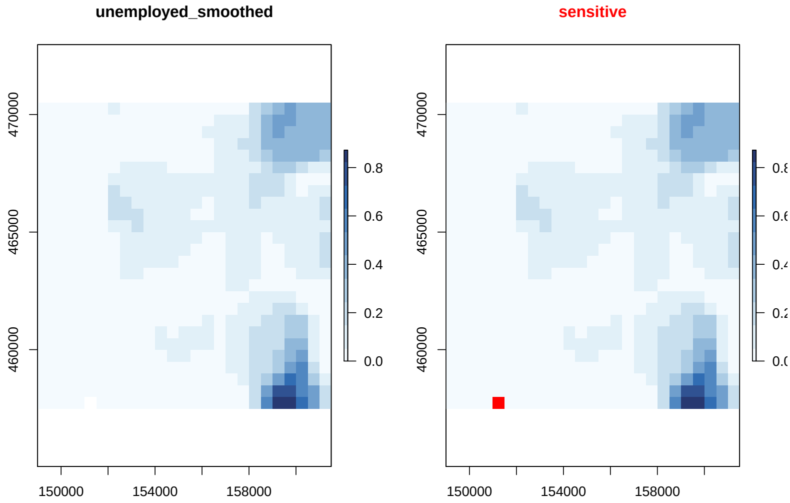
- Simple and easy explainable

Cons

- Detailed spatial patterns are removed
- visually unattractive: “Blocky”

Option: KDE-smoothing

```
unemployed_smoothed <- protect_smooth(unemployed, bw = 1500
plot(unemployed_smoothed)
```



Options: KDE-smoothing

Pro's

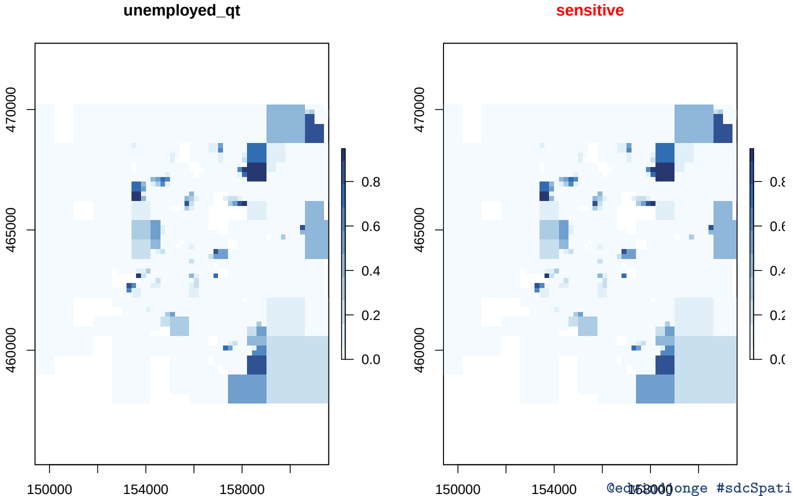
- Often enhances spatial pattern visualisation.
- Makes it a density map, e.g. contour map

Con's

- Does not remove all sensitive values (depends on bandwidth `bw`)
- A fixed band width is used for all locations: may removed detailed patterns
  spatial processes often have location dependent band widths. (= future work)

Option: Quadtree

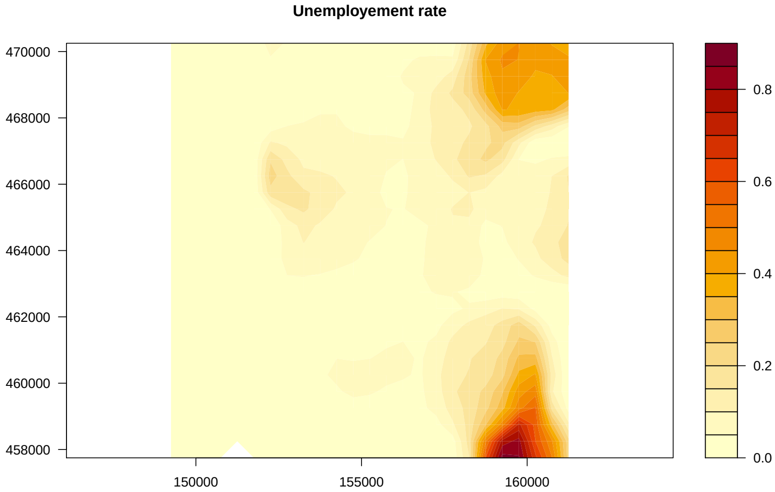
```
unemployed_100m <- sdc_raster(dwellings[c("x","y")], dwelli
unemployed_qt <- protect_quadtree(unemployed_100m)
plot(unemployed_qt)
```



Publish: visual interpolation

- To make the raster visually more attractive, but still safe:

```
raster::filledContour(mean(unemployed_smoothed), main="Unemployement rate")
```



Option: Quadtree

Pro

- Adapts to data density
- Adjusts until no sensitive data is left.

Cons

- Visually: "Blocky" / "Mondrian-like" result.

Cons

The end

Thank you for your atention!

Questions?

Curious?

```
install.packages("sdcSpatial")
```

Feedback and suggestions?
